

The Long Way to a Page

SPECIMEN

One document exercising the layout this engine implements: floats, tables, the box model, positioned boxes and shaped text, all the way through to PDF.

krilla.html > us-letter 816 × 1056 > liberation sans, serif, mono > pdfium at 96 dpi

Text in a shortened band

The panel to the right is a float. It is out of flow, so the heading above it keeps its full width and this paragraph keeps its own — what changes is the *line* boxes inside it, each shortened by the floats it overlaps.

Text is shaped rather than summed: advances come from `rustybuzz`, the shaper krilla already links, so kerning pairs and the **fi** and **fl** ligatures affect where a line breaks and not merely how it looks.

Match the browser’s construction, not its description — the pixels are the only thing that settles an argument.

AT A GLANCE

- Parser** AngleSharp
- Shaper** rustybuzz, via krilla
- Writer** krilla
- Units** CSS pixels, 96 per inch
- Fidelity** measured against Chrome

Boxes, borders and backgrounds

The chart alongside is not an image. Each bar is a block whose percentage width resolves against the track beside its label, and the numbers are this page’s own: the column, the band the text above wraps into beside the panel, and the panel itself.

Corpus categories, and what each one is there to catch

Category	Measures	Scenarios
block	the box model and collapsing margins	11
float	line shortening, stacking, clearance	4
table	column widths, spans and captions	7
text	kerning, ligatures, alignment	6
